

# #### Cardo User Import Script - Useful Information ###

## # INTRODUCTION

The user import script takes inputs from the "**UserImport.csv**" file, checks if a user already exists or not, then creates an account for them if they do not already exist.

## # HOW TO USE THE SCRIPT

\*\*\* As the main source of input for user creation is the "UserImport.csv", make sure that the script is always in the same folder with the csv file before running the script. To make things easy, there is an excel file (UserImportTemplate.xlsx) that can be used to automate the entries – we strongly recommend that you use this template.

\*\*\* Most fields that are required for the successful creation of user accounts are automatically populated once First name and Last name have been entered.

**Note: Please make sure that IsFieldOperative field is set to operative if the user is an operative – setting this field correctly will apply all the necessary licenses that an operative needs to their account.**

## # STEPS

1. First open the "UserImportTemplate.xlsx" file and add user details under the fields. The only required fields are First name and Last name.
2. Once the template is populated with the details, save a copy of the file in csv format and make sure the name is exactly "UserImport.csv"
3. Check to make sure that the csv file and PowerShell script are in the same folder
4. Run the script with PowerShell
5. Examine the PowerShell results to see if the accounts were created or not.
6. Done!
