

=====

Cardo User Import Script v9 - April 2025

=====

*** This version includes new addresses for Kingston and Romford ***

Please note that all the scripts in this release need to have "UserImport.csv" file in the same location with the script that you want to run. Make sure that the file is populated with all the necessary information. The "UserImportTemplate.xlsx" file is designed to simplify the process of adding user details. It is highly recommended that the excel template is used to populate user info, but do remember to either save as "UserImport.csv" or simply copy the populated rows from the excel file to the csv file already provided. If there are any questions, please email peter.james@nexusos.co.uk

Breakdown of what these scripts do:

*** CardoUserImportScript.ps1 ***

Can be used for importing new users. The Excel file must be populated and saved as UserImport.csv. Remember not to include invalid entries to avoid errors when script runs.

*** Set_D365_Field_License.ps1 ***

Assigns or unassigns the Dynamic Field Service to or from a user respectively.

*** Set_Operative_Or_NonOperative.ps1 ***

Assigns a user either as operative or not. This script also automates the task of moving a user between respective OUs

*** Update_Address.ps1 ***

Updates a user's address and postal code. Use this script if you need to update addresses and post code of users. Please note that the addresses and post codes are hard coded into the Excel template, so you only need to specify the username and which location the user belongs to on the excel template before running the script.

*** Update_MobileNumber.ps1 ***

Updates a user's mobile number.

*** Process_Leavers.ps1 ***

Can disable or enable an account and move account to the right OU. Disabled accounts will automatically lose their licenses.

*** Get_PhoneAuthenticationMethod.ps1 ***

Pulls the record of users' current phone authentication details

*** Remove_PhoneAuthenticationMethod.ps1 ***

Removes users' current phone authentication details. Must set correct PhoneAuthenticationMethodID before running script

*** Add_PhoneAuthenticationMethod.ps1 ***

Adds phone authentication record for user

*** Remove_MobileNumber.ps1 ***

Removes mobile number from users in Active Directory

NOTES ON THE EXCEL TEMPLATE

1. First name and last name are required fields
 2. Street address and post code are automatically populated once correct company and location have been selected
 3. Account Status is set to enabled automatically. Set this to disabled when processing leavers
 4. Mobile number must be entered in the format +44 7756166xxx
 5. Mobile numbers used for authentication only must be added to the AuthenticationPhone field
- ** Remember to save the template as UserImport.csv before running a script and to avoid errors, remember to remove unwanted rows.
