

Cardo User Script v12 - June 2025

For any of the scripts to run successfully, the “userimport.csv” file must have been populated, and it must be in the same location as the script.

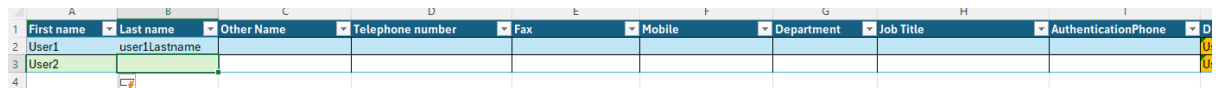

How to populate the csv file:

1. Open the “UserImportTemplate.xlsx” file

1	A	B	C	D	E	F	G	H	I	J
	First name	Last name	Other Name	Telephone number	Fax	Mobile	Department	Job Title	AuthenticationPhone	Dropdown

2. Enter the details of a single user in the row. Additional rows will be added automatically when data is entered in the immediate next row.

1	A	B	C	D	E	F	G	H	I	J
	First name	Last name	Other Name	Telephone number	Fax	Mobile	Department	Job Title	AuthenticationPhone	Dropdown
2	User1	user1lastname								
3	User2									

What you add to the template depends on what you want to achieve, please see additional information in the sections below.

Setting up a new user

If setting a new user, we need to do three things:

1. Populate the template with the details of the user(s).
 - a. Start by opening the template file
 - b. Enter the details of the user. Required fields are:
 - i. **Firstname** – must not contain any space. If a user has more than two names, enter the other name in the Other Name field
 - ii. **Lastname** – Must not contain spaces
 - iii. **Company** – select from the dropdown. Must be populated for office locations to show
 - iv. **OfficeLocation** – select from the dropdown
 - v. **IsFieldOperative** – set this to operative if user is an operative or set it to no if user is not an operative
 - c. Confirm that other fields like user principal name, address and post code have been automatically populated.

- d. Enter any additional details that you need to set for the user.
For example, if the user needs a Dynamics Field Service License, set the field to yes. You can also populate Job title etc.
 - e. For additional users on the same template, you can simply pull down the fields that are the same to populate them faster.
2. Save the template as **“userimport.csv”** and ensure that it is saved in the same location as the script
 3. Run the **“CreateNewUser”** script and observe the messages on the PowerShell window

Processing a leaver

After running the script, the leaver will have their email converted to a shared mailbox, sign-in disabled and their account moved to _Leavers OU on the DC.

1. Populate the template (then csv) with the details of the user. Only the user principal name and Account Status fields are required for this action
2. Run the “Leaver_Script” and follow the instructions and messages on the screen

Adding or Removing Dynamics 365 Filed Service License

A user can be assigned dynamic filed service license during creation. However, there might be a need to assign or remove dynamic field service license from an existing user.

1. Add the details of the user to the csv file – **you only need to fill the “user principal name” and D365FieldService fields**
2. To remove D365 license, set **D365FieldService** to “No”. To add D365 license, set **D365FieldService** to Yes
3. Run **“Set_D365_Field_License”** script

Switching a user between operative and non-operative

Where a user's job role changes between operative and non-operative, please follow the same principles as above and do the following:

1. Populate the template. You need to set the **you only need to fill the “*user principal name*”, “*Department*” and “*IsFieldOperative*” fields**
2. Run the “Set_Operative_Or_NonOperative.ps1” script and observe the messages on the prompt

Other scripts can also be used by following the same principles as above.

Any questions, please contact Nexus Service Desk.
